

GATEWAY WEST

GATEWAY WEST

Project Location:

Various sites in Idaho and Wyoming

Project Description:

Our survey work for this project was performed to assist our geotechnical department with a large geotechnical study that encompassed five different sites spread from Downey, Idaho to Casper, Wyoming. We were tasked with staking approximately 100 borehole locations in an extremely short amount of time. We performed the work using Trimble GPS systems. The project was challenging for many reasons. We experienced harsh weather conditions and each of the sites was located in very remote areas. The work however went smoothly and was completed within the allotted time frame.
